

# Database Design 1: Conceptual Modelling

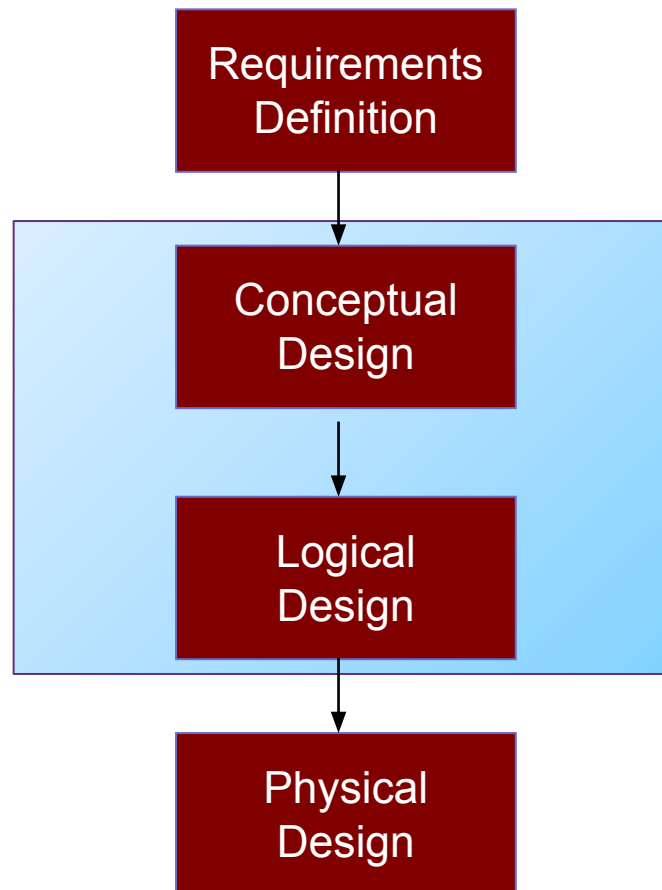

FIT9132

# ANSI/SPARC architecture

# The Database Design Life Cycle

# Requirements Definition

- Identify and analyse user views.
- A 'user view' may be a report to be produced or a particular type of transaction that should be supported.
- Corresponds to the external level of the ANSI/SPARC architecture.
- Output is a statement of specifications which describes the user views' particular requirements and constraints.

# ER Modeling

- ER (Entity-Relationship) model developed by Peter Chen in 1976 to aid database design.
- May be used for conceptual (ERD)/logical design (ERD like).
- ER diagrams give a visual indication of the design.
- Basic components:
  - Entity
  - Attribute
  - Relationship

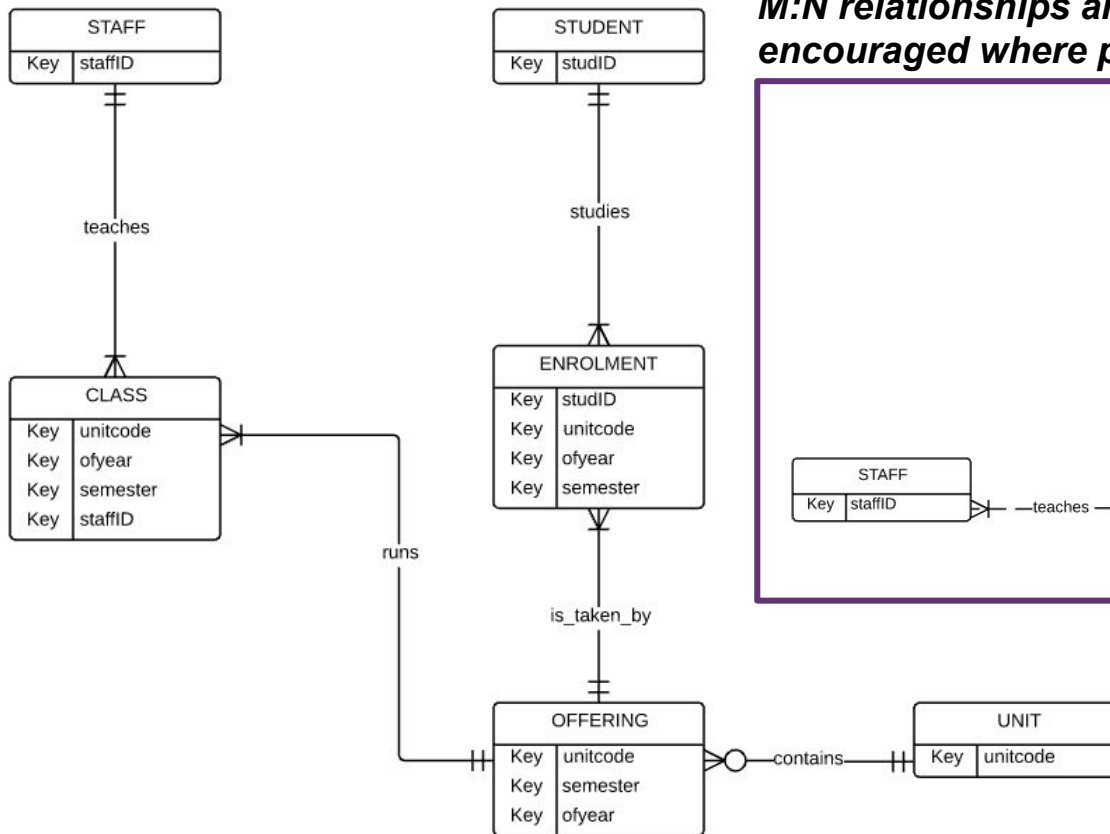

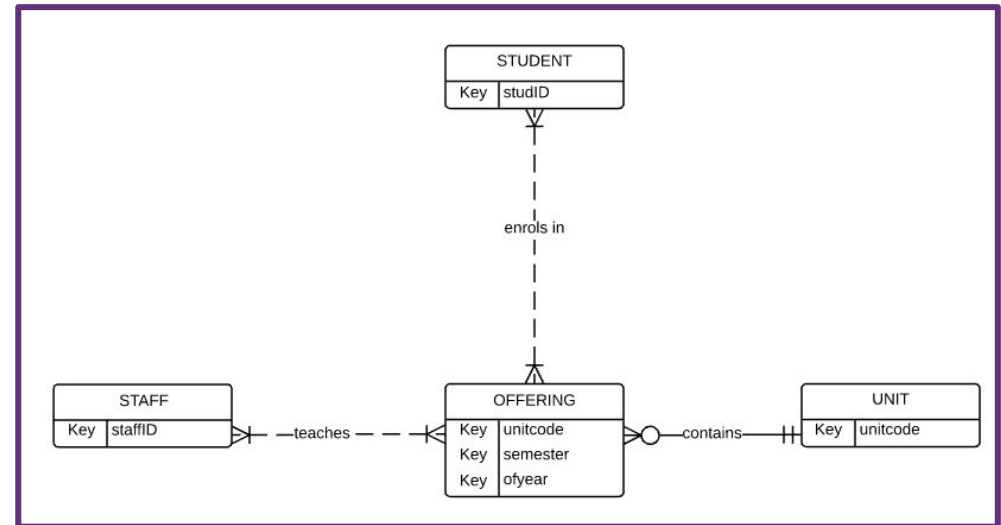

# Conceptual Design

- Develop the enterprise data model.
- Corresponds to the conceptual level of the ANSI/SPARC architecture.
- Independent of all physical implementation considerations.
- Various design methodologies may be employed, including the ER (Entity-Relationship) approach.
- ER consists of ENTITIES and RELATIONSHIPS between entities
  - An ENTITY will have attributes (things we wish to record), one or more of which will identify an entity instance (called the KEY)

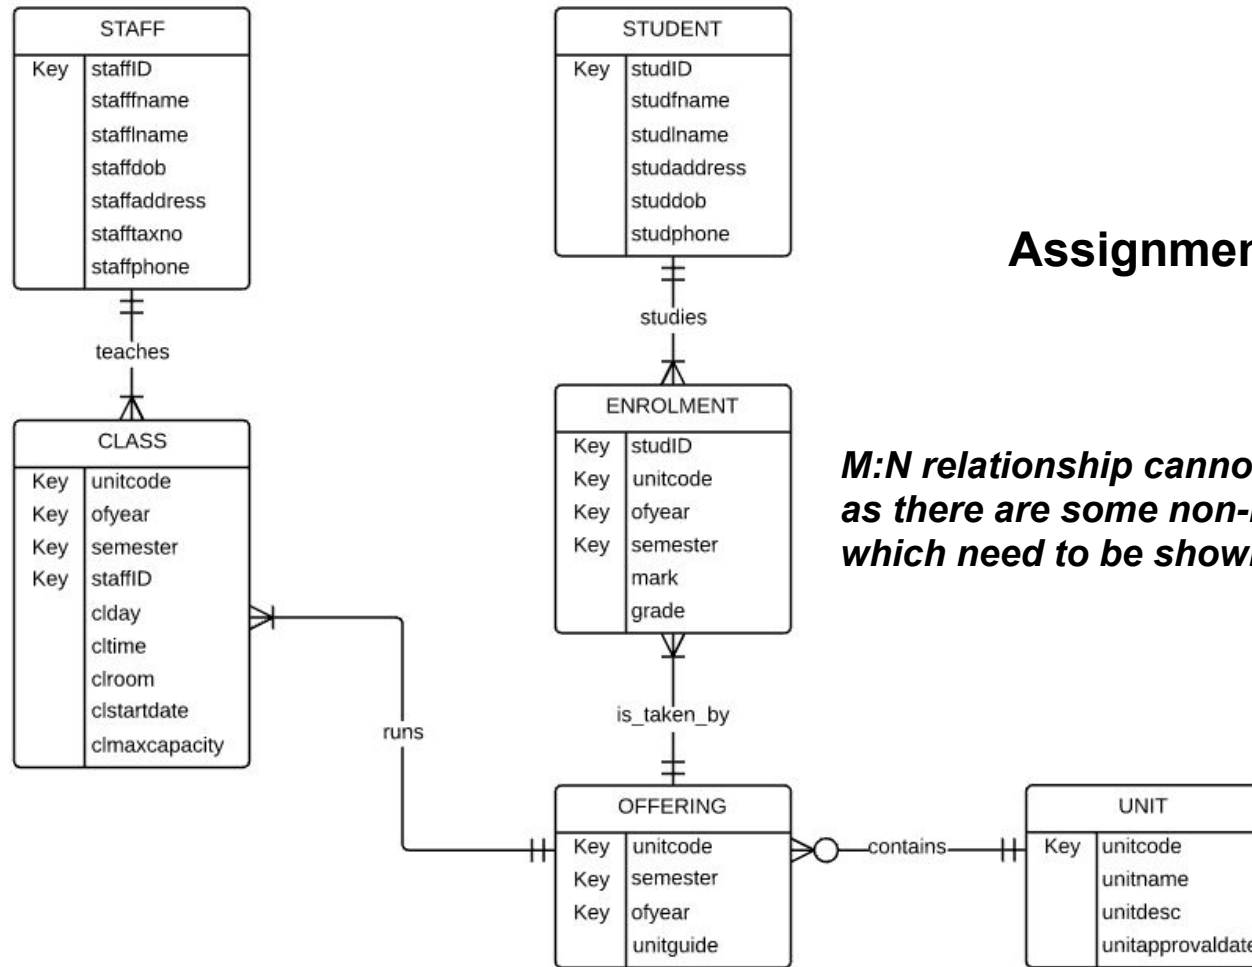

# Conceptual Level (ER Model) - Keys only

*M:N relationships are fine on a Conceptual model (and encouraged where possible) as they simplify the model:*

# Conceptual Level (ER Model) – All Attributes

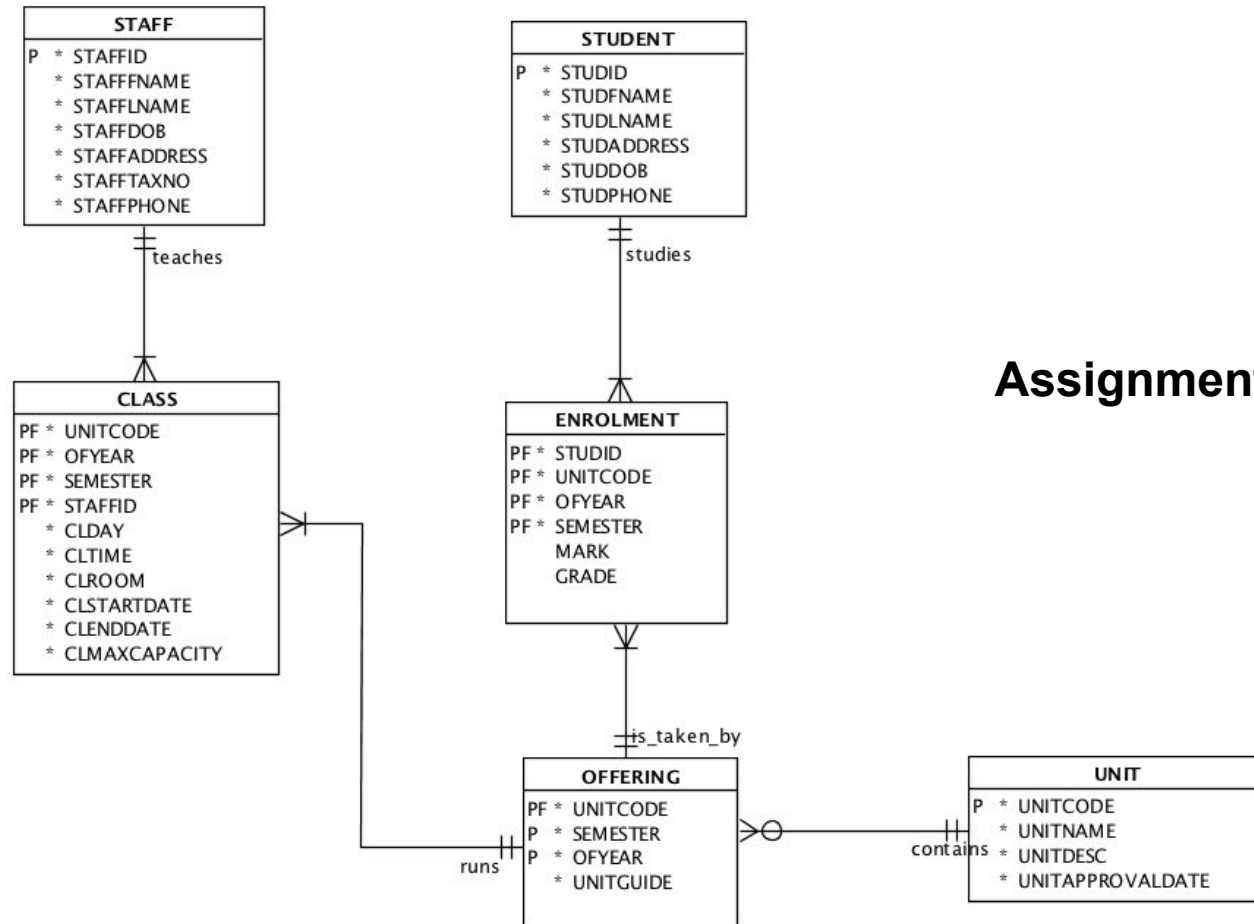

## Assignment 1

***M:N relationship cannot be used here as there are some non-key attributes which need to be shown***

# Logical Design

- Develop a data model which targets a particular database model (e.g. relational, hierarchical, network, object-oriented).
- Independent of any implementation details which are specific to any particular DBMS package.
- Normalisation technique (see week 5) is used to test the correctness of the logical model.
- May also be considered to correspond to the conceptual level of the ANSI/SPARC architecture.

# Logical Level (Logical Model - Relational)

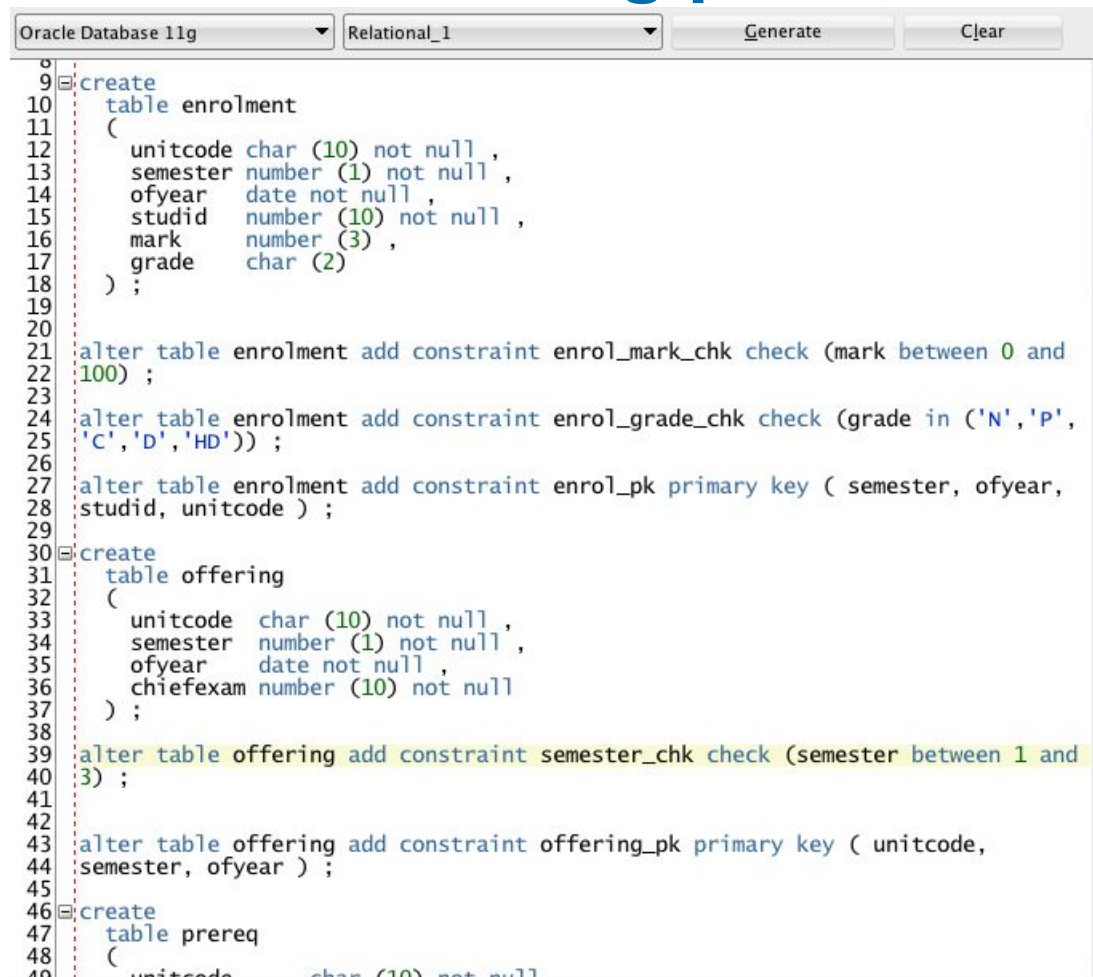

## Assignment 2

# Physical Design

- Develop a strategy for the physical implementation of the logical data model.
- Choose appropriate storage structures, indexes, file organisations and access methods which will most efficiently support the user requirements.
- Physical design phase is dependent on the particular DBMS environment in use.
- ANSI/SPARC internal level.
- Shown in SQL Developer Data Modeller as the Relational Model

# Physical Level – Starting point

The screenshot shows an Oracle SQL Developer window with the following details:

- Database: Oracle Database 11g
- Schema: Relational\_1
- Buttons: Generate, Clear

```

# ENTITY RELATIONSHIP DIAGRAM

# ERD - Notation

**Chen**

**Information  
Engineering/James  
Martin/Crows foot**

# ERD – Notation cont'd

## Chen's Notation

- Semantically rich.
- Complex diagram.
- 'Pure' conceptual level.

## Information Engineering

- Less semantics.
- Simpler diagram.
- Mix between conceptual and logical levels.

# Entity, Attributes and Relationships

*Please note this diagram is incomplete*

**Q1. How many entities are there in the above diagram?**

- A. 1
- B. 2
- C. 3
- D. 4

*Please note this diagram is incomplete*

**Q2. How many relationship are there on the above diagram?**

**What is **the degree** of the relationship (the number of entities participating in the relationship) ?**

- A. 1, unary
- B. 2, binary
- C. 1, binary
- D. 3, ternary

**Q3. "An employee is assigned to be a member of a team. A team with more than 5 members will have a team leader. The members of the team elect the team leader."**

**List the entity(s) which you can identify in the above statement. place each on a separate line - use SHIFT+ENTER for a new line.**

**Q4. How many relationships connect TEAM and EMPLOYEE?**

- A. 1
- B. 2
- C. 3
- D. 4

**FIGURE 4.7**

**Connectivity and cardinality in an ERD**

*In general for Crows Foot notation specific cardinalities are not shown as above eg. (1,4), instead participation is depicted via min and max participation using the standard symbols (Inside symbol = min, outside symbol = max)*

**CONNECTIVITY**

**one to one**

**one to many**

**many to many**

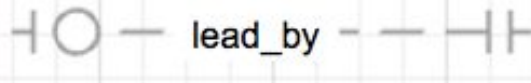

## Relationship Participation

**Q5. "A Team with more than 5 members will have a team leader. The members of the team elect the team leader."**

**What is the relationship participation of the relationship**

**TEAM --- lead\_by --- EMPLOYEE**

A. 

B. 

C. 

**Q6. "The company also introduced a mentoring program, whereby a new employee will be paired with someone who has been in the company longer."**

**How many entity/ies do you need to model the mentoring program?**

- A. 1
- B. 2
- C. 3

FIGURE  
4.15

### Three types of relationship degree

**Q7. "To attract high calibre talent, the company provides generous remuneration package as well as health insurance support for the employees and their family. To do this, the HR team needs to know the details of the family members. The family information will be recorded"**

**Choose a TRUE statement.**

- A. EMPLOYEE entity is a strong entity and FAMILY is a strong entity.
- B. EMPLOYEE entity is a weak entity and FAMILY is a strong entity.
- C. EMPLOYEE entity is a strong entity and FAMILY is a weak entity.
- D. EMPLOYEE entity is a strong entity and FAMILY is strong entity.

# Weak vs Strong Entity

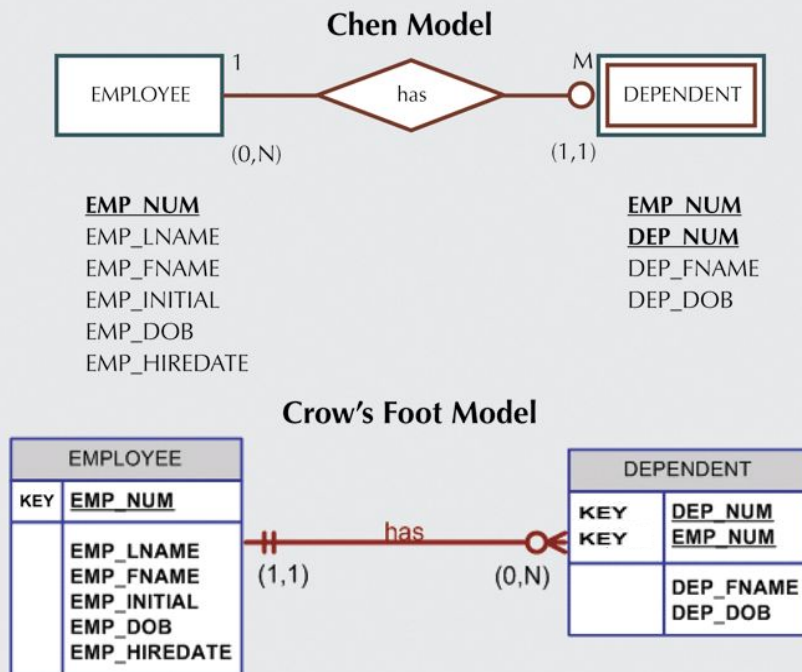

- Strong entity
  - Has a key which may be defined without reference to other entities.
  - For example EMPLOYEE entity.
- Weak entity
  - Has a key which requires the existence of one or more other entities.
  - For example FAMILY entity - need to include the key of employee to create a suitable key for family
- Database designer often determines whether an entity can be described as weak based on business rules
  - customer pays monthly account
    - Key: cust\_no, date\_paid, or
    - Key: payment\_no (surrogate? – not at conceptual level)

# Weak vs Strong Entity

FIGURE 4.10

A weak entity in an ERD

SOURCE: Course Technology/Cengage Learning

*Note the Crow's Foot model shown here has been modified from the text version*

# Identifying vs Non-Identifying Relationship

- **Identifying**

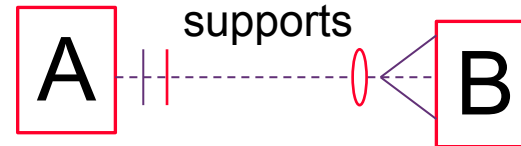

- Identifier of A is part of identifier of B.

- Shown with solid line
- ENROLMENT - STUDENT  
Enrolment key includes student id, which is an identifier of student.

- **Non-identifying**

- Identifier of A is NOT part of identifier of B.

- Shown with broken line
- Department no (identifier of department) is not part of Employee's identifier.

# Types of Attributes

- Simple
    - Cannot be subdivided
    - Age, sex, marital status
  - Composite
    - Can be subdivided into additional attributes
    - Address into street, city, zip
  - Single-valued
    - Can have only a single value
    - Person has one social security number
- Multi-valued
    - Can have many values
    - Person may have several college degrees
  - Derived
    - Can be derived with algorithm
    - Age can be derived from date of birth
  - Attribute classification is driven by Client requirements
    - Phone Number?

**Q8. The employee details that will be recorded are:**

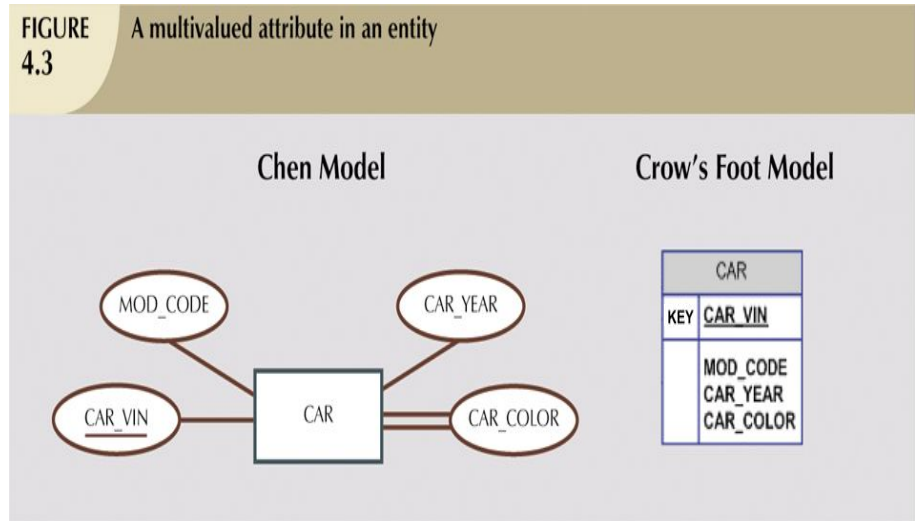

**Employee number, Full name, Address, Date of birth, Tax file number and Skill(s). Examples of skills are Java, Python, UNIX, Relational db, MongoDB, etc**

**Choose a TRUE statement.**

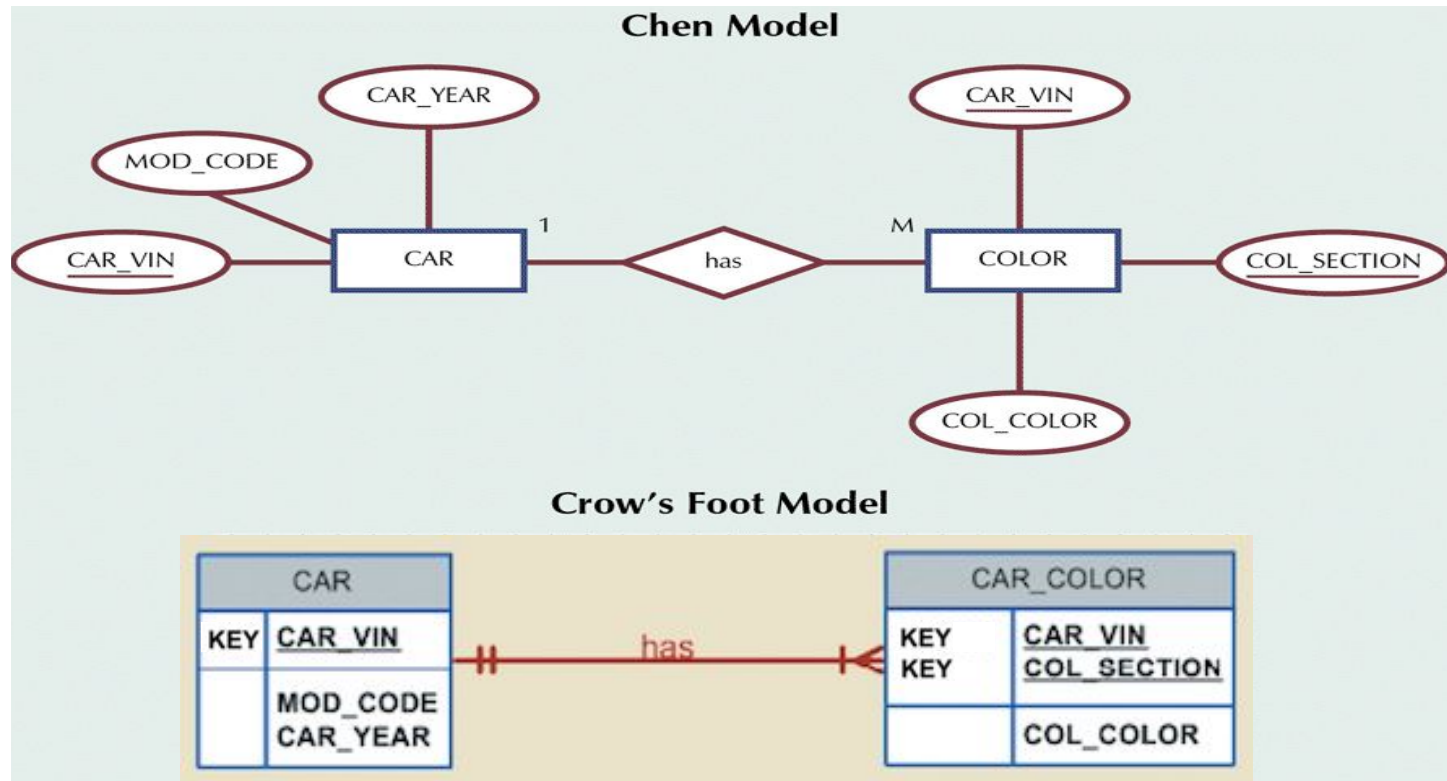

- A. ADDRESS is a multi-valued attribute and SKILL is a multi-valued attribute.
- B. ADDRESS is a composite attribute and SKILL is a composite attribute.
- C. ADDRESS is a composite attribute and SKILL is a multi-valued attribute.
- D. ADDRESS is a multi-valued attribute and SKILL is a composite attribute.

# Multivalued Attribute

- An attribute that has a list of values.
- For example:
  - Car colour may consist of body colour, trim colour, bumper colour.
- Crow's foot notation does not support multivalued attributes. Values are listed as a separate attribute.

# Resolving Multivalued Attributes

*... "the company provides several in-house training programs. The HR team needs to keep track of the details about who has done what. An employee can do several training programs.*

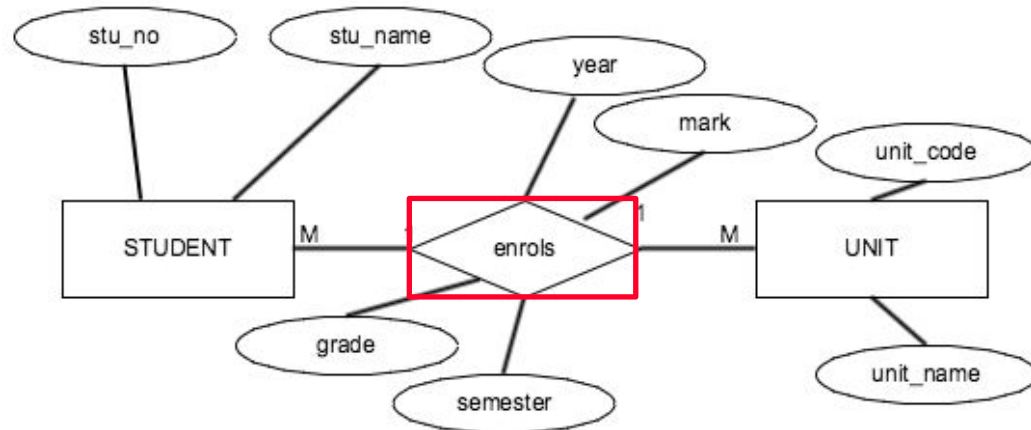

*At the completion of a training, a certificate will be provided to the employee containing the training name and the completion date."*...

## Incomplete model

*Incomplete model*

# Associative (or Composite) Entity

Note cannot add skill\_no  
since this would be a  
SURROGATE key, there is no  
skill\_no in the described case
